

CarterPCs — fix-v18

Hardware image: STOPPED at the clean-source check

The supplied image (Downloads\pc.jpg, 1024×572) carries an overlaid four-pointed star badge in its bottom-right corner — the attribution stamp AI-image tools composite over generated output. It is not part of the scene. Per the task's own precondition (“Stop and report if the supplied image is not clean”) nothing was implemented: any shippable framing would either show the badge or push it out of frame, and “crop around” is explicitly forbidden.

No file was changed. The source image was read only. git status is exactly as fix-v17 left it; fix-v17's green validation chain remains the state of the tree.

To proceed: a clean export of this image (no corner badge) with licence confirmation, ideally $\geq 1400 \times 1000$ px — the composition itself (PC and hands right, dark negative space left) is exactly right for the slot, and the implementation plan is ready to run on re-supply.

Evidence: 01-bottom-right-corner-4x.png (the badge at 4×), 02-other-corners-clean.png, 00-supplied-image-reference.png.

[00-supplied-image-reference.png](#)

The supplied image as received (1024x572). Composition is right for the slot - but see the bottom-right corner.

01-bottom-right-corner-4x.png

Bottom-right corner at 4x: a flat light-grey four-pointed star composited over the desk - a generator attribution badge, not scene content.

02-other-corners-clean.png

The other three corners (top-left, top-right, bottom-left): clean.

03-recheck-same-badge.png

RE-CHECK after the task was re-submitted as "approved clean": the file on disk is byte-identical and the badge is still present, same position.
